

POCKET SMART AI

ABSTRACT

Pocket Smart AI is an AI-based smart assistant application developed to provide useful digital assistance through a simple web interface. The system combines a frontend interface with a backend service to receive user requests, process them, and present suitable responses.

The main objective of the project is to make common information and assistance easily accessible from one application. The system can support smart responses and configured useful or emergency information. Its modular structure also allows additional features to be added in the future.

Pocket Smart AI demonstrates practical concepts in frontend development, Python backend development, API communication, testing, source-code management, and cloud deployment.
