

POCKET SMART AI

INTRODUCTION

Artificial Intelligence is increasingly used in applications that provide automated assistance and information. A smart assistant can help users obtain useful responses through a single digital interface.

Pocket Smart AI is designed as a simple web-based smart assistant. The user interacts with the frontend, while the backend handles application processing and returns the result.

OBJECTIVES

- To develop a simple AI-based smart assistant.
- To provide an easy interface for user interaction.
- To integrate frontend and backend components.
- To provide useful assistance quickly.
- To demonstrate application development and deployment.

SCOPE

The system can be extended with voice support, multilingual support, authentication, database connectivity, additional AI capabilities, and mobile support.
