

POCKET SMART AI

IMPLEMENTATION

IMPLEMENTATION OVERVIEW

Pocket Smart AI is implemented as a web application consisting of frontend and backend components.

FRONTEND

HTML can provide page structure, CSS can provide presentation, and JavaScript can provide interaction and communication with the backend.

BACKEND

Python with Flask can be used to create the backend service. The backend receives requests, processes them, and returns responses.

SOURCE CODE MANAGEMENT

The project source code can be maintained using GitHub. Version control helps organize the project and supports deployment.

DEPLOYMENT

The application can be deployed on a cloud platform such as Render. Correct dependencies, application entry point, and start command are required.

SECURITY

Sensitive values such as API keys should be stored using environment variables and should not be exposed in public source code.
